DESCRIPTORS Degrees (Titles), *Dental Assistants, *Dental Hygienists, *Dental Technicians, Educational Background, Educational Resources, Enrollment, *Health Occupations Education, Program Length, *Statistical Data

ABSTRACT

Information in tabular form on dental hygiene, dental assisting, and dentist laboratory technology programs includes: (1) basic information about the programs, (2) preadmission training of students, and (3) admission data on students. For dental hygiene programs, information on undergraduate enrollment as of October 15, 1968 and distribution of undergraduate students 1968-69 for the United States and Canada are also included. The introduction presents additional statistics for 1962 and 1968 and points up some important statistics: (1) 85 schools offered dental hygiene programs in the United States in 1968 (a 21 percent increase) to 5,187 students (a 20 percent increase), and most commonly awarded the associate degree, (2) There were 134 dental assisting programs in 1968 (a 33 percent increase) and a student enrollment of 4,475 (a 17 percent increase), (3) Programs varied in length from 27 weeks to 80 weeks with 55 percent of the programs approximating one academic year, and (4) The number of schools offering dental laboratory technology programs increased from 15 to 19 between 1967 and 1968 and enrollment increased 10 percent for a total of 803. ANNUAL REPORT ON DENTAL AUXILIARY EDUCATION

The attitudes of practicing dentists toward auxiliary personnel vary widely, ranging from those who employ no auxiliaries and regard them negatively, to those who do employ them and "wouldn't be without them." Fortunately, the negative extreme is an attitude held by a small number of dentists that is growing smaller.

In "The 1968 Survey of Dental Practice," it was estimated that self-employed dentists had 136,400 full-time and 37,800 part-time auxiliaries in their employ. These figures were 17 percent higher than the 116,300 full-time and 35 percent higher than the 28,000 part-time employees of three years earlier. Since there was less than a 2 percent increase in the number of practicing dentists from 1965 to 1968, it is obvious that the use of auxiliary personnel greatly intensified over the three year period.

The wider use of auxiliary personnel can probably be attributed to the dental schools, whose courses in dental auxiliary utilization are offered at the undergraduate and continuing education levels. The reason for the dental schools teaching courses in auxiliary utilization is, of course, the efficiency that auxiliaries bring to dental practice – a fact that has been documented in many studies. One such study, "The 1965 Survey of Dental Practice," showed that in 1964, dentists with no employees had an average of 2,355 patient visits. The employment of one full-time auxiliary saw the average patient load increase 41 percent to 3,015; two full-time auxiliaries brought the average number of patient visits to 3,946; three full-time auxiliaries to 4,409, and four or more, to 6,170.

The gradual rise of the population-per-dentist ratio has prompted wide discussion on increasing the scope of duties of auxiliary personnel. Experiments such as those performed at Great Lakes Naval Training Center and the University of Louisville School of Dentistry have demonstrated that a) certain routine duties can be performed by chairside auxiliaries with no loss in quality, and b) the patient loads of practicing dentists were substantially increased.

Thus, the dramatic increase in the number of auxiliary personnel that occurred between 1965 and 1968 posed a quantitative challenge to dental auxiliary education that was met by opening more schools. The drive to broaden the duties of chairside auxiliaries has resulted in several states rescinding laws that formerly prohibited auxiliaries from performing these duties, and the experimental evidence cited above has created a favorable atmosphere in some other state legislatures. Therein lies the new challenge to dental auxiliary education – revising curricula to include training in certain tasks traditionally performed by dentists.

DENTAL HYGIENE

A listing of schools with dental hygiene programs is contained in **Table 1**. Those schools listed either have accredited programs, or will receive accreditation when their first class graduates. **Table 1** shows that 15 new programs were established in 1968, an increase of 21 percent over 1967. The 15 new programs gives the United States a total of 85.

Table 2 shows the enrollment in dental hygiene programs in the schools of the United States and Canada. The number of first year students increased from 2,036 in 1967 to 2,624 in 1968, or 29 percent. During the same span, total enrollment rose 20 percent, from 4,309 to 5,187.

Undergraduate enrollment has increased steadily since 1960, the average increment being at the rate of 13.5 percent. The 5,187 dental hygiene students in 1968 was more than double the 2,497 students in 1960 (**Fig. 1**).

Figure 2 shows the number of dental hygiene graduates for each year from 1960. The average rate of increase over the years shown was 10.6 percent. The 20 percent increase in enrollment from 1967 to 1968 was not, of course, reflected in the rate of increase for the number of graduates.

FIG. 1
UNDERGRADUATE ENROLLMENT IN THE DENTAL HYGIENE SCHOOLS OF THE UNITED STATES AND CANADA 1960-1968

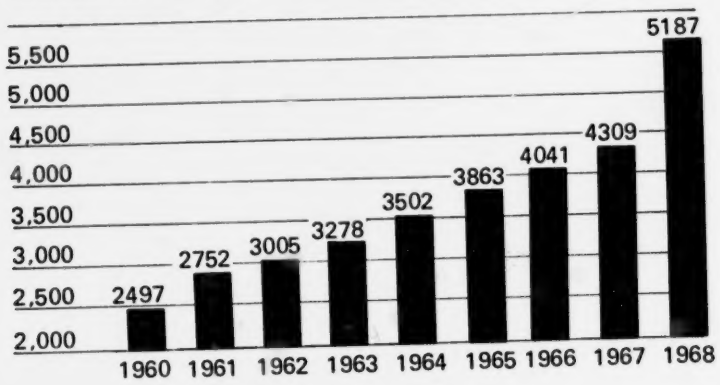

FIG. 2
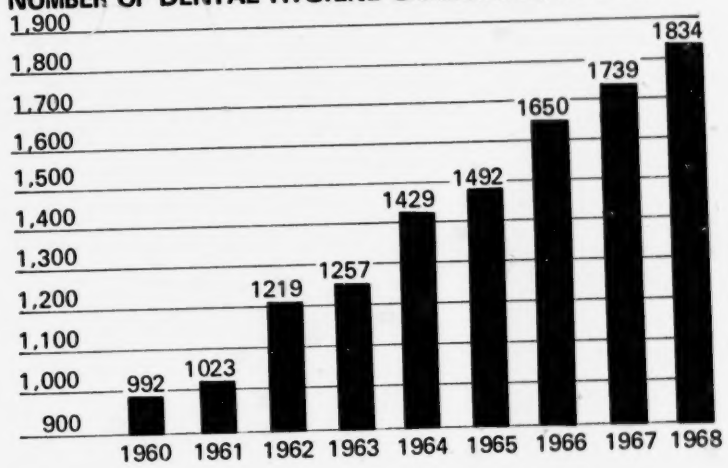
NUMBER OF DENTAL HYGIENE GRADUATES 1960-1968



The pre-admission training of first year dental hygiene students is shown in **Table 3**. The distribution of first year students according to the level of pre-admission training was: 51.0 percent, high school only; 22.7 percent, one year of college; 22.2 percent, two years of college; 3.2 percent, three years of college; .2 percent, four years of college, and .7 percent had received a college degree.

Table 4 shows the admission requirements for each dental hygiene school. Eighty percent of the schools require a high school education, 8 percent require one year of college, and 12 percent require two years of college. Sixteen schools offered two programs — 15 offering a two year and a four year program, and the other one offering a two year and a three year program. An additional 10 schools required two years of college prior to admission. Of the 16 schools that offered courses of more than two years in length, and of the 10 schools that required two years of college prior to admission, 24 awarded bachelor degrees upon successful completion of their programs. The remaining schools offered associate degrees, certificates and degrees and certificates to their graduates. The associate degree was by far the most commonly awarded document of graduation.

Table 5 shows the distribution of dental hygiene students by state and province.

DENTAL ASSISTING

Table 6 is a listing of accredited dental assisting programs in the United States, as of October 15, 1968. There were 134 schools with accredited dental assisting programs, about a third more than on October 15, 1967.

Figure 3 shows the enrollment in accredited dental assisting programs from 1962 through 1968. During these years, enrollment has grown by more than three times. The 4,475 students enrolled in 1968 represented an increase of 17 percent from the 3,819 enrolled in 1967. This increase in enrollment is certainly a healthy one, but when it is recalled that **Table 6** indicated that the number of schools with accredited programs rose 33 percent from 1967 to 1968, it seems fair to conclude that at present, there is an over-capacity of dental assistant teaching facilities that may be substantial.

The number of graduates from dental assisting programs from 1962 through 1968 is shown in **Fig. 4**. During this seven year period, the number of graduates more than tripled. The increase from 1,963 in 1967 to 2,302 in 1968 amounted to 17 percent.

FIG. 3
UNDERGRADUATE ENROLLMENT IN THE DENTAL ASSISTING SCHOOLS OF THE UNITED STATES AND CANADA 1960-1968

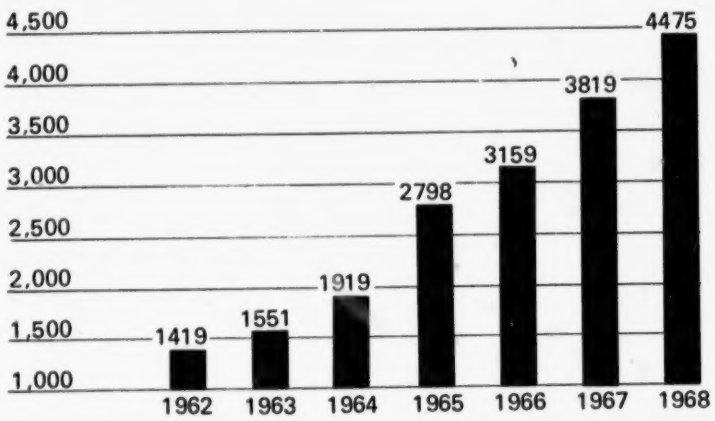


FIG. 4
NUMBER OF DENTAL ASSISTING GRADUATES 1962-1968

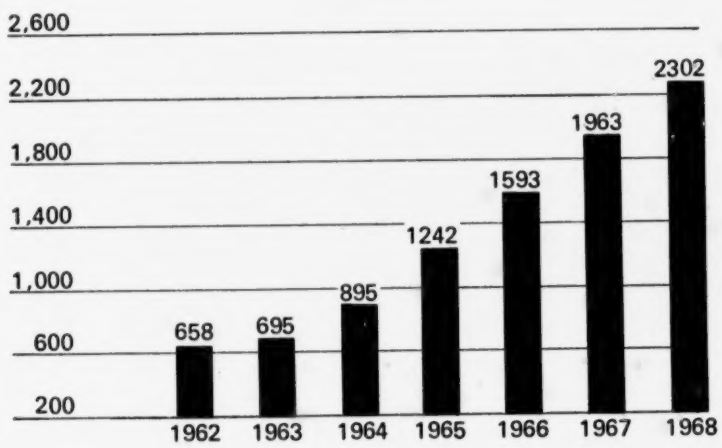

Table 7 shows the pre-admission training of dental assisting students. Graduation from high school was the level of education of 87 percent of the first year students in 1968. An additional 11 percent attended college for one to two years, but received no degree or certificate. The remaining 2 percent was distributed among students who received no high school diploma, those who had two years of college with a degree or certificate, and those who had more than two years of college.

The length of the course, the type of document awarded upon successful completion of the course and tuition is shown for each of the 134 dental assisting schools in **Table 8**. The courses varied in length from 27 to 80 weeks, with 55 percent of the schools offering programs approximating one academic year; 16 percent offered programs ranging from one academic year to one calendar year; and 25 percent had programs from one calendar year to two academic years. The remaining 4 percent of the schools had two programs, usually of one and two academic years in length. The type of document awarded upon completion of the course depended upon the length of the course and the type of school. Graduates of courses that were approximately one academic year in length received certificates, whereas graduates from courses of two academic years in length usually received associate degrees and certificates. While course length was a factor in the cost of tuition, the most important determinant was the type of school and the bearing that this had on the student's permanent residence.

DENTAL LABORATORY TECHNOLOGY

Table 9 lists schools with accredited dental laboratory technology programs as of October 15, 1968. There were 19 such schools, four more than in the fall of 1967.

Figure 5 illustrates the growth in enrollment in dental laboratory programs since 1962. During this time, enrollment rose 172 percent, thanks mainly to spurts of 49 percent from 1965 to 1966 and 43 percent from 1966 to 1967. Enrollment in 1968 was 10 percent higher than in 1967.

The sharp rise in enrollment in 1966 was reflected in the number of graduates in 1968. There were 325 dental laboratory technicians graduated in 1968, or twice as many as were graduated in 1967 (**Fig. 6**).

FIG. 5
UNDERGRADUATE ENROLLMENT IN THE DENTAL LABORATORY TECHNOLOGY SCHOOLS OF THE UNITED STATES AND CANADA 1962-1968

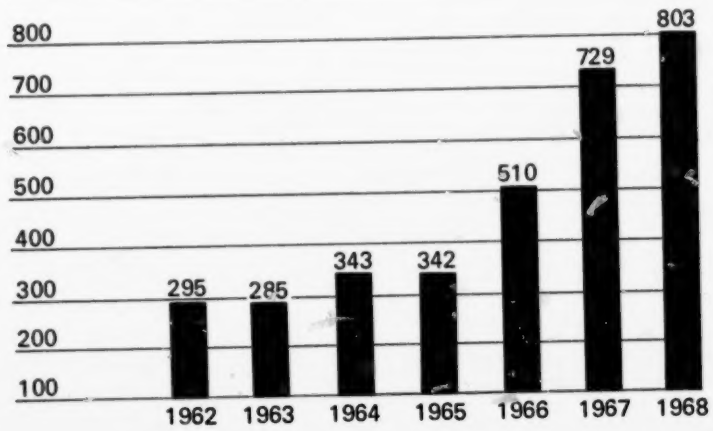

FIG. 6
NUMBER OF DENTAL LABORATORY TECHNOLOGY GRADUATES 1962-1968

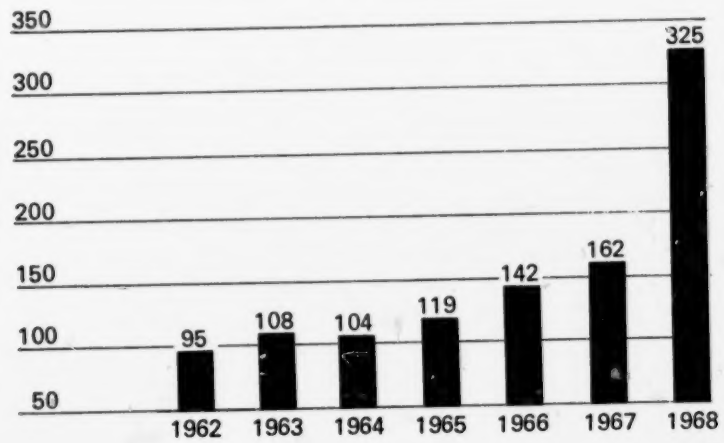

Table 10 shows the pre-admission training of first year laboratory technicians. As in dental hygiene and dental assisting, the vast majority or 71 percent, were educated through the high school level. Seventeen percent had one year of college, 7 percent had two years of college, and the remaining 5 percent was divided among students with three years of college, four years of college, and a college degree.

Dental laboratory technician programs varied in length from six months at Sheppard Air Force Base to 24 months at Casa Loma College, New York City Community College and James Connally Technical Institute (**Table 11**). The programs at 11 of the 19 schools ran for 20 months or longer, 6 ran for 18 months, 1 for 16 months, and 1 for 6 months. The type of document awarded upon successful completion of the program depended upon the type of school. With the lone exception of the one six-month program, there was not enough variance in the length of the courses offered by the different schools to make course-length a factor in determining whether a graduate would receive an associate degree or a certificate.
